FuturEnzyme

Technologies of the FUTURe for low-cost ENZYMEs for environment-friendly products

WP 2
12 months meeting

Project funded by the European Union's Horizon 2020
Research and Innovation Programme under grant agreement No [101000327]

Original image: Illustration by Ainhoa Quirós

Work package number [9]	WP2	Lead beneficiary [10]	2 - BSC
Work package title	Machine learning enzyme bio-prospecting integrated into an industrial context		
Start month	1	End month	48

Participation per Partner

Partner number and short name	WP2 effort
1 - CSIC	3.00
2 - BSC	32.00
3 - BANGOR	2.00
4 - UHAM	6.00
5 - UDUS	1.00
13 - SCHOELLER	4.00
14 - HENKEL	2.00
15 - EVO	1.00
Total	51.00

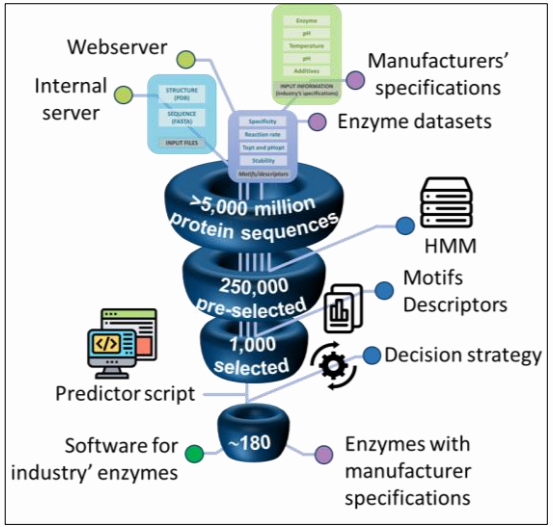
Objectives

Task 2.1. Compile the on-demand manufacturers' needs and specifications M1-M6
Task Lead Partner – CSIC
Participants: SCHOELLER, HENKEL, EVO

Task 2.2 Pre-selecting candidate sequences through extensive homology search M1-M48
Task Lead Partner – UHAM
Participants: BSC, CSIC, UDUS, BANGOR

Task 2.3 Motif buildup for massive and smart search of enzymes fitting manufacturers' needs M1-M42
Task Lead Partner – BSC
Participants: CSIC

Task 2.4 Iterative and decision-making hierarchical procedure for speed up enzyme discovery M3-M48
Lead partner – BSC
Participants: CSIC, UDUS, BANGOR, UHAM



*HMM: Hidden Markov Model

Summary

- Real-life substrates have been provided by HENKEL, EVONIK and SCHOELLER.
- The enzymes to focus on and the process and products specificiations have been provided by HENKEL, EVONIK and SCHOELLER.
- An exhaustive bibliographic (scientific and patent) search has been completed.
- A draft HMM and computational pipeline was implemented for sequence-based enzyme discovery.
- First enzyme candidates have been selected and datasets obtained to be further integrated into the predictive tool.
- Selected enzymes have been tested through both computational (BSC) and experimental (CSIC) methodologies.

Task 2.1 Compile the on-demand manufacturers' needs and specificiations M1-M6

- **HENKEL, EVONIK and SCHOELLER** have already supplied the partners with the real samples to work with, namely, real-life hyaluronic acid (added to real-file cosmetics), liquid detergents and textiles/fabrics; this is key because we started working with real samples very early on.
- **HENKEL, EVONIK and SCHOELLER** have defined and shared with partners the needs and specifications, including enzymes of interest, substrates to work with, conditions at which enzymes should work, etc.
- **CSIC** has performed an exhaustive patent and bibliographic search for the:
  - Production of hyaluronic acid for cosmetics
  - Use of enzymes in detergent compositions
  - Use of enzymes in textile industry

Manufacturers' needs and specifications

	LIQUID/DOSE CAP DETERGENT
Products to be made	Laundry & Home Care (LHC)'s leading premium liquid detergent and/or unit dose caps products with enzymes.
Request	Enzymes for removing fatty oil stains.
Innovation	Innovation will come because the use of enzymes will improve removal of stubborn stains at low temperatures while decreasing chemical usage. A central point is to lower the amount of surfactant in the detergent formulation as much as possible by adding enzymes.
Priority enzymes to be targeted	Among all enzyme classes discussed in the proposal, priority target will be enzymes for removing specific fatty oil stains, that will include: • True lipases (EC 3.1.1.3) • Esterases (EC 3.1.1.1) • Cutinases (EC 3.1.1.74) and related fatty-oil degrading hydrolases
Non-priority enzymes to be targeted	Aside the priority classes, other enzyme classes relevant to detergents are also considered, that include: • Proteases/peptidases, suitable for protein-based stain removal (i.e. blood, milk, grass) at low temperature, e.g., type family S08 (alcalase), type papain (EC 3.4.22.2), type savinase-esperase (EC 3.4.21.14), type subtilisin-alcalase (EC 3.4.21.62), type trypsin and protease inhibitor. • Amylase (EC 3.2.1.1) and other glycoside hydrolases • Peroxidases and related enzymes (EC 1.1.3.-, EC 1.11.1.- or EC 1.10.3.2), very specific in the potential use case (to be discussed in more detail in case they become relevant).
Specifications that enzymes should meet	The enzymes should be active and stable under conditions relevant to the wash cycle and to storage. Below, the specifications are summarized: • The enzymes should be stable for at least 2 to 3 months at 30˚C in the liquid detergent formulation. Note: This stability refers to the stability of the enzymes in the detergent formulation. • The enzymes should be effective and stable at a washing temperature between 20 and 40˚C and at pH 7.0-8.5, at least during an operation time of a common wash cycle (120 min). Note: This stability and activity refer to that of the enzymes in a wash liquor mimicking the detergent-water mixture in a washing machine; this wash liquor consists in about 50 g liquid detergent per 20 liter of water.

Manufacturers' needs and specifications

	COSMETIC FORMULATIONS
Products to be made	EVO's leading cosmetics integrating ingredients produced by enzymes
Request	Enzymes for degrading hyaluronic acid to products of defined size to be integrated into cosmetics
Innovation	Hyaluronic acid is widely used for cosmetic applications where it mainly acts as natural moisturizer and as anti-aging active. Specially, the biological anti-aging activity is limited by the enormous molecular size of hyaluronic acid that can reach up to 2,000 kDa and interferes with its penetration into the skin. Fragmentation of large hyaluronic acid polymers can markedly improve its penetration abilities. Nevertheless, pro-inflammatory responses have been reported for very small hyaluronic acid fragments (5-15 kDa) which are recognized by special receptors of the immune-system; therefore, size matters, and has to be above or below a specific threshold. In this case it should be below 5 kDA, prefered 1-2 kDa, so that the new molecule will better penetrate into the skin, making the cosmetic more effective, and the production process more sustainable.
Priority enzymes to be targeted	Priority targets will be enzymes degrading hyaluronic acid: • Heparanase (EC 3.2.1.166) • Hyaluronate lyase (cd01083 - EC 4.2.2.1) • Hyaluronidase (EC 3.2.1.35, EC3.2.1.36, pfam03662, pfam01630).
Specifications that enzymes should meet	Hyaluronic acid is actually produced by fermentation of Bacillus subtilis (non-pathogenic) and an environmentally friendly, solvent free recovery process. Existing technologies like thermal degradation are unsuitable for achieving the targeted molecular weight and polydispersity. We can envision two options for producing small hyaluronic acid with 1-2 kDA molecular weight: • An enzyme that can be added during the fermentation to prevent additional process steps to make the small hyaluronic acid. The possibility that the new enzyme can be integrated into the Bacillus subtilis that produce the hyaluronic acid may be also evaluated. • An enzyme that can be added after fermentation in the current solvent free process, which should improve the LCA. The fermentation conditions and the thermal denaturation conditions cannot be provided by Evonik. CSIC will start a large bibliographic and patent search to find most common conditions for such processes.

Manufacturers' needs and specifications

Priority	1	2	3
Possible applications/scope	Cleaning/pretreatment of synthetic fibres	Chalk marks	Replacement of the bleaching processes
Substrate	Polyester fibres (PES) / polyamide fibres (PA) containing elastane (polyether-polyurea copolymer)	Cotton (CO), polyester fibres (PES), polyamide fibres (PA)	Cotton (CO)
Desired effect/change	Fully removal of spinning additives (see details below*)	Solving the problem of writing on the finished textile	Decoloring of natural fibres and cotton hasks
State of the art	Solvent cleaning or insufficient washing, which creates problems in the subsequent processing	F-based marks for hydrophobic materials	Chemical bleaching (Chlorid or Peroxid)
Impact to Schoeller	Huge	Huge	Low
Impact to other textile producers	Huge	Huge	High
Priority High-Med-Low	High	High	High to Low
Lab application possible?	Yes	Yes	Yes
Test method	Analytical extraction	Physical, observational	Chemical test tensile, degree of whiteness and DP (degree of average polimerization)
Effect/result proof	Reducing dyeing, finishing problems and second quality products	With less chemicals, similar effects	Achieving maximum whiteness and reducing dye stuff
How to quantify	1. Avoiding solvents 2. Bulk trial dyeing comparison	Calculating the sparing amounts of chalkmarks	Saving on chemicals
Reducing reworks and off-quality	Yes	Yes, sparing quite a lot of money through the whole textile processing chain	To some extent
Comments	-	-	-
Priority enzymes to be targeted	Lipases, cutinases, poliuretanases, amidases	Lipases, esterases, poliuretanases, amidases, cellulases	Bleaching enzymes (oxidoreductases)
Conditions for process/product	See details below*		See details below*
Screening method for enzymes	The methods for screening and characterizing the enzymes need to be adapted by partners, as detailed in Deliverable 3.2.	The methods for screening and characterizing the enzymes need to be adapted by partners, as detailed in Deliverable 3.2.	The methods for screening and characterizing the enzymes need to be adapted by partners, as detailed in Deliverable 3.2.

Manufacturers' needs and specifications

Priority	4	5	6
Possible applications/scope	Surface functionalization/modification	Improved hydrophilicity	Improved hydrophobicity
Substrate	Polyester fibres (PES), modification and plasma treatment	Polyester fibres (PES) / polyamide fibres (PA) containing elastane (polyether-polyurea copolymer)	Polyester fibres (PES) / polyamide fibres (PA) containing elastane (polyether-polyurea copolymer)
Desired effect/change	Generating functional groups/layers	Higher absorbency (by pre-processing) and better humidity management (finishing)	Better water /soil repellency with less chemicals, removal of residual substrates
State of the art	Heating (natriumhydroxide) and atmospheric plasma	Solvent cleaning	Higher amounts of chemicals
Impact to Schoeller	Medium	Huge	Huge
Impact to other textile producers	Medium	Huge	Huge
Priority High-Med-Low	Low	High	High
Lab application possible?	Yes	Yes	Yes
Test method	Physical testing (permanent treatments)	Physical testing- absorbency	Physical testing
Effect/result proof	Bonding strenghts and higher washability	Improved dyeing process, moisture management	Improved water and soil repellency with less chemicals
How to quantify	Managable	Hydrophil tests for uniform hydrophilicity	Reduction of used chemicals
Reducing reworks and off-quality	No	Yes	Yes
Comments	-	-	-
Priority enzymes to be targeted	Lipases, cutinases, esterases	Lipases, cutinases, poliuretanases, amidases, proteases (subtilisin, bromelain type)	Lipases, cutinases, poliuretanases, amidases, proteases (papain)
Conditions for process/product	See details below*	See details below*	See details below*
Screening method for enzymes	The methods for screening and characterizing the enzymes need to be adapted by partners, as detailed in Deliverable 3.2	The methods for screening and characterizing the enzymes need to be adapted by partners, as detailed in Deliverable 3.2	The methods for screening and characterizing the enzymes need to be adapted by partners, as detailed in Deliverable 3.2

Manufacturers' needs and specifications

Priority	7	8	9
Possible applications/scope	Improved fixation of PA dyeing (amino multiplier?)	Fewer water consumption in the dyeing process	Higher effectiveness of existing enzyme treatments on natural and synthetic fibres
Substrate	Polyamide fibres (PA)	Polyester fibres (PES), cotton (CO)	Cellulosic fibre
Desired effect/change	Better fixation with fewer color consumption	Still large amounts of water is consumed in dyeing process; yet to be defined whether reduction is possible by enzyme treatment	Desizing, bleaching, bio-polishing
State of the art	Chemicals treatment	Extensive rinsing process a high water and time consuming process	Chemicals
Impact to Schoeller	High	High, technical feasibility with enzymes hard to realise	Too Low
Impact to other textile producers	High	High	Relevant
Priority High-Med-Low	Medium	High - see comments	Low
Lab application possible?	Yes	Yes	-
Test method	Fastness, dye consumption tests	-	-
Effect/result proof	Less dye materials and improved fastness	-	-
How to quantify	Dye stuff consumption and fastness	Water energy saving	Quite time-consuming compared to the existing processes
Reducing reworks and off-quality	Yes, especially reducing chemicals	-	-
Comments	-	-	Schoeller is using amylases for desizing of cellulosic frequently
Priority enzymes to be targeted	Amidases, proteases (alcalase, subtilisin), lipases, esterases	Lipases, cutinases, cellulases	Cellulases and amylases
Conditions for process/product	See details below*	See details below*	See details below*
Screening method for enzymes	The methods for screening and characterizing the enzymes need to be adapted by partners, as detailed in Deliverable 3.2.	The methods for screening and characterizing the enzymes need to be adapted by partners, as detailed in Deliverable 3.2.	The methods for screening and characterizing the enzymes need to be adapted by partners, as detailed in Deliverable 3.2.

Manufacturers' needs and specifications

The substrate generally used for bio-processing includes paraffin, mineral oil, silicon oil, acrylic acids, and ester oils, and those chemicals need to be eliminated at the end of the processing procedure by the action of enzymes to avoid extensive water consumption.

Chemistry used for polyamide (PA)/polyethylene terephthalate(PET)/polyester (PES) fibres, would be:

- Thermostable ester oils as lubricants.
- Various fatty alcohol, fatty acid or fatty acid amide derivatives, ethoxylated or ethoxylated / propoxylated as emulsifier / wetting agent / cohesion component.
- Phosphoric acid esters, phosphonic acid derivatives as antistatic agents.
- Small amounts of antioxidants, corrosion protection agents and in some cases in-can preservatives.

Chemistry used for polyurethane (PUE) filaments would be:

- Low-viscosity silicone oils (PDMS) as lubricants.
- Low-viscosity mineral oils as lubricants.
- Magnesium stearate as a release agent.

Regarding texturing preparation, as a rule, 2 preparations are applied.

1. First, spin preparation during the spinning of the partially orientated yarn (POY) filament (layer approx. 0.4 percent by weight): ethylene oxide (EO) / propylene oxide (PO) copolymers as lubricants, fatty alcohol alkoxylates as wetting / spreading agents. Possibly small amounts of fatty acid ethoxylate as wetting / spreading agent or cohesive component. Smallest amounts of phosphoric acid ester as an antistatic agent.
2. During texturing, before winding, a winding oil (application approx. 1.5 - 3 percent by weight): mineral oil as a lubricant, fatty alcohol / fatty acid ethoxylate as an emulsifier.

In Europe in particular, there are always discussions in connection with emissions on the stenter caused by spool oil, and mineral oil in particular is held responsible for this. That is why there are also more thermally stable winding oils, but they are correspondingly more expensive and therefore not very common. There the mineral oil gets through replaces thermostable ester oils or carbonic acid esters (Bozetto technology).

Task 2.2 Pre-selecting candidate sequences through extensive homology search M1-M48

- **CSIC** designed and used a reference a manually curated database with 37,403 diverse protein sequences featuring enzyme families relevant to the project to screen a total of 670 million sequences from 13 public and internal metagenomes, and 48 genomes
- A total of 3,153,537 sequences were selected by running Diamond after screening
- Network analysis was performed, and 481 clusters identified.
- One enzyme per cluster was selected and using computational analysis 108 were found to encode full length proteins with catalytic residues and domains.
- Actually, 47 genes have been subjected to gene synthesis.

Note: in next slide the in silico pipeline for enzyme search and selection is detailed

Task 2.3 Motif building for massive and smart search of enzymes fitting manufacturers' needs M1-M42

Up to now CSIC have compiled the characteristics (substrate specificity, activity in conditions relevant to the project, T_{opt}, pH_{opt} and T_d) of 84 enzymes (lipases, hyaluronidases) relevant for detergents, textiles and hyaluronic acid. This information will be further integrated into the predictive tool. *Note: for characteristics see WP4.*

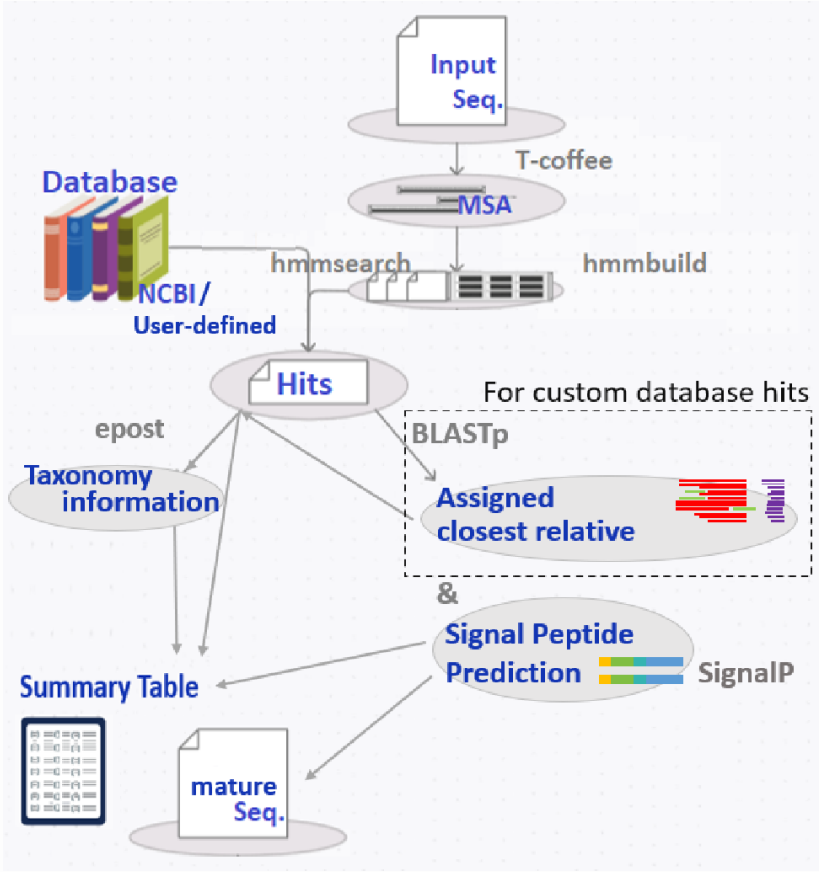
Task 2.4 Iterative and decision-making hierarchical procedure for speed up enzyme discovery

- Construction of Hidden Markov Models (HMMs) for searching both global databases and private datasets

- Development of the AHA-Tool: an **A**utomatic **H**MM Search and **A**nalysis Tool

AHA-Tool v.1.0 functions:

- Multiple Sequence Alignment
- Data & DB formatting
- HMM build
- HMM search
- Sequence extraction
- BLAST
- Taxonomy gathering
- Secretion peptide prediction



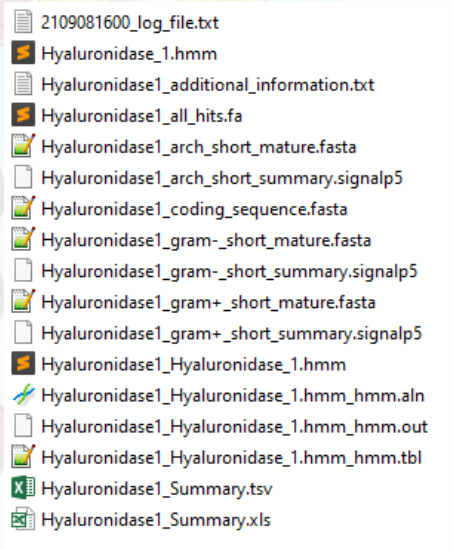
AHA-Tool v.1.0 functions:

- Multiple Sequence Alignment
- Data & DB formatting
- HMM build
- HMM search
- Sequence extraction
- BLAST
- Taxonomy gathering
- Secretion peptide prediction

v.2.0 updates:

- Automatic detection of input file (fasta or hmm)
- Automatic update of NCBI's non-redundant database
- Connectivity check with NCBI server prior to BLAST
- Computing of a maximum likelihood tree with RAxML
- Macro plug-in for automatic taxonomy graphs in Excel
- New output table
- New folder structure
- Code simplified and minor bugs corrected
- Possibility to concatenate jobs

```
mibi_hh01@mibihh01-Precision-5820:/media/mibi_hh01/4TB_SSD/PABLO/AHATool$ bash AHATool.sh -h
USAGE: AHATool.sh [flags] args
flags:
  -p,--prefix:  The prefix the tool will use for produced files. (default: '2205201755')
  -i,--input:  the input file (fasta, aln or hmm). (default: 'sequences.fasta')
  -d,--database:  database options: 1. nr_db; 2. custom_db (default: 'nr.fa')
  -u,--update:  database update if possible? yes/no? (default: 'yes')
  -c,--cladogram:  Prepare tree file for cladogram? yes/no? (default: 'yes')
  -e,--evalue:  e-value (recommended: 1e-10). (default: 0.0000000001)
  -t,--threads:  processor options: 1, 2, 4 (default: 2)
  -h,--help:  show this help (default: false)
```



```
nanopore@nanopore-OptiPlex-7050:/media/nanopore/248d77f7-21d3-4d0e-84bf-9a1d36e43deb1/PABLO/BScNele/AHATool$ bash AHATool.sh -p Hyaluronidase1 -i Hyaluronidase_1.hmm -d nr.fa -u no -c no -t 4

======================================================================
Welcome to AHATool: an Automatic HMM and Analysis Tool.
V.2
Microbiology and Biotechnology - Streit's lab
University of Hamburg (D)
Developed by Nele Schulte (and P.Pérez-García)
======================================================================
Executed on 08.09.2021 04:00:38  by nanopore
AHATool will be executed with the following parameters:
Directory to work in: /media/nanopore/248d77f7-21d3-4d0e-84bf-9a1d36e43deb1/PABLO/BScNele/AHATool
Database: nr.fa
Number of threads: 4
Input file: Hyaluronidase_1.hmm
E-value: 0.0000000001
Output prefix: Hyaluronidase1
RAxML tree: no
Checked for online connection to NCBI.
======================================================================
Checking for needed software:
--------------------------------
 All needed packages are installed.
======================================================================
Checking the input folder...
--------------------------------
Files found: 12
FASTA files found: 2
======================================================================
Checking for needed files:
--------------------------------
 Database (nr.fa) exists.
 Index file (nr.fa.ssi) exists.
======================================================================
The files created within this run will be identifiable by the prefix
"Hyaluronidase1".
They will be saved in the folder /Project_Results
and the subfolder "2109081600".
======================================================================
Searching profile HMM against given database...
```

Outlook

- Apply tool for identifying candidates from other enzyme classes
- Input sequences from partners needed!
- Hyaluronidases, solvent stable enzymes etc.

From the previous selected 108 sequences, a characterization followed by PELE simulations were done.

- Enzyme characterization (catalytic residues, domains, etc)
- PELE simulations for protein and ligand systems

Initial Protein Characterization

PFAM

Complete domains:

Significant Pfam-A Matches

Show or hide all alignments.

Family	Description	Entry type	Clan	Envelope		Alignment		HMM		HMM length	Bit score	E-value	Predicted active sites	Show/hide alignment
				Start	End	Start	End	From	To					
Alpha-amylase	Alpha amylase, catalytic domain	Domain	CL0058	55	406	55	401	1	335	337	393.0	1.5e-117	n/a	Show
Malt_amylase_C	Maltogenic Amylase, C-terminal domain	Domain	CL0369	506	580	506	579	1	74	75	39.2	5.5e-10	n/a	Show

Insignificant Pfam-A Matches

Show or hide all alignments.

Family	Description	Entry type	Clan	Envelope		Alignment		HMM		HMM length	Bit score	E-value	Predicted active sites	Show/hide alignment
				Start	End	Start	End	From	To

Conclusions and Future Perspectives WorkPackage 2

- Combine experimental and computational results to refine the simulations
- Use the AHA-tool for finding new enzymes
- Do a second iteration of bioprospecting and filtering
- Extend to other activities that have not been tested yet
- Select the best sequences to create better mutants (WP-5)

FuturEnzyme

Technologies of the FUTURe for low-cost ENZYMEs for environment-friendly products
